

LOANZO

Verified Loan Utilization & Repayment Platform

Complete product concept, user flows, rule engine, verification architecture, repayment lifecycle, API roadmap and MVP scope.

Core innovation: Loanzo creates a shared, auditable trail showing how each tranche is requested, who the intended payee is, why it is being paid, whether the payee is verified, what was disbursed, and how repayment progresses.

1. What is Loanzo?

Loanzo is a two-sided lending transparency platform for borrowers and lenders. It is designed around verified, itemized utilization rather than a simple loan balance. The product can support formal and informal lending contexts, including bank/personal lending and optional asset-pledge records.

Problem	Loanzo solution	Value
Fragmented loan records	One shared loan ledger	Transparency
Unclear fund destination	Verified payee + direct-to-payee flow	Traceability
Purpose difficult to monitor	Purpose/payee consistency rules	Early warnings
Repayment tracked manually	Schedule + ledger + reminders	Clear outstanding balance
Informal collateral records	Digital pledge record	Better documentation

The source report defines the core trail as Loan → Disbursement → Payee → Purpose → Verification → Utilization → Repayment.

2. Complete User Journey

The source report identifies onboarding as Mobile/Email → PAN → Aadhaar → Selfie/Liveness → Verified Profile and provides borrower and lender dashboards. ■filecite■turn0file0■L78-L102■

3. Disbursement Flow

Design principle: for purpose-linked tranches, the preferred flow is lender → verified payee. The borrower specifies the intended recipient and purpose, while the lender retains the approval decision.

The source report specifies tranche requests, payee verification, lender review, itemized ledger entries and mismatch flagging. [filecite turn0file0 L120-L140](#)

Prototype note: a UPI deep-link initiates a payment in the lender's UPI app; it does not itself prove successful settlement. Production Loanzo should use an appropriate transaction-confirmation mechanism.

4. Repayment Flow

The report includes repayment scheduling, reminders, outstanding-balance updates and asset-pledge records.

filecite0turn0file0L304-L312

5. Rule Engine

Condition	Result
Amount > remaining sanctioned limit	Hard block
Payee verified + purpose category matches	Consistent
Purpose category differs from payee category	Mismatch → lender review
Payee cannot be verified	Unverified → lender review
Repeated / inconsistent pattern	Review / warning
Low amount + verified payee + no mismatch + below lender threshold	Can be auto-approved
Mismatch / unverified / above threshold	Manual approval

Examples: Medical + Hospital/Pharmacy = consistent; Education + recognized institution = consistent; Medical + Electronics store = mismatch. The report frames these as transparent, rule-based checks rather than an autonomous fraud-detection claim. ■filecite■turn0file0■L132-L140■

6. Utilization Dashboard

Loanzo calculates verified utilization from itemized, purpose-tagged records rather than a manually entered balance.

$$\text{Verified Utilization \%} = \frac{\text{Verified disbursements with matched payee} + \text{confirmed transaction reference}}{\text{Total Disbursed Amount}} \times 100$$

Example	Value
Total disbursed	■50,000
Verified utilization	■42,000
Dashboard result	84%
Remaining	■8,000 — pending / unverified / flagged
■50,000 DISBURSED Total tracked amount	
↓	
■42,000 VERIFIED Matched payee + confirmed reference	
↓	
■8,000 REMAINING Pending / unverified / flagged	

The source report gives the same ■50,000 / ■42,000 example and separates the remainder by verification status.
■filecite■turn0file0■L144-L163■

7. KYC & Verification Architecture

The existing report identifies PAN/Aadhaar verification, selfie+liveness, and bank/UPI verification as the identity/payment layer. ■filecite■turn0file0■L81-L84■

Prototype: use provider sandbox/test data; do not use classmates' real Aadhaar/PAN details merely for demonstration.

8. Account Aggregator — Future Financial Data Layer

Account Aggregator (AA) is a later-stage financial-data capability, not the basic disbursement mechanism. With appropriate consent and an eligible FIU setup, AA can support affordability analysis and potentially transaction-based utilization analysis within the permitted consent scope.

The source report describes Setu's AA sandbox as the realistic prototype route and states that production AA access requires an eligible FIU arrangement or regulated partner. ■filecite■turn0file0■L229-L256■

Important: AA data should not be presented as automatic proof of a particular UPI payment. Payment confirmation and bank-data analysis are separate evidence sources.

9. Core Data Model

Entity	Key fields
User	userId, role, KYC status, payment identity
Loan	loanId, lender, borrower, amount, type, interest model, status
Disbursement	id, loanId, amount, payee, purpose, verification, transaction ref, timestamp
Repayment	id, loanId, amount, transaction ref, timestamp, outstanding snapshot
Payee	id, name, UPI/GST, verification, category
Pledge	asset description, value, photo/reference, receipt status
AuditEvent	actor, event, old state, new state, timestamp, reference

Recommended architecture:

10. Technology & MVP

Layer	Recommended stack
Mobile	Kotlin + Jetpack Compose
Local / background	Room + WorkManager
Backend	Spring Boot
Database	PostgreSQL
Authentication	Firebase Auth or custom auth
Integrations	KYC provider, GST/business verification, UPI deep-links, OTP, gold-rate API
Analytics	Rule engine + dashboard charts

MVP phases:

11. API Stack & Real-vs-Roadmap Boundary

Component	Prototype status
KYC — PAN/Aadhaar/liveness/OCR	Provider integration / sandbox
Gold rate	Live API possible
GST/business verification	Live API possible
UPI payee/payment initiation	Native UPI deep-link
Mobile OTP	SMS provider
e-Sign	Provider integration
Bank-statement-level AA data	Roadmap — eligible FIU/regulated partnership
Pooled fund custody	Roadmap — appropriate business/payment setup
Stranger-to-stranger lending marketplace	Requires applicable regulatory licensing

The source report explicitly separates live-buildable components from AA, pooled-fund custody and regulated P2P marketplace capabilities. ■filecite■turn0file0■L324-L334■

12. Final Product Positioning

LOANZO = VERIFIED LOAN UTILIZATION + REPAYMENT LAYER

Loanzo is not simply a loan or expense tracker. It connects borrowers, lenders, disbursements, payees, purposes, verification, utilization, repayments and optional collateral into one transparent digital trail. The source report emphasizes that this improves visibility and documentation rather than guaranteeing that borrowed money can never be misused. ■filecite■turn0file0■L336-L342■
